

AgriLED Impact – Kyenjojo District

Transforming Rural Livelihoods Through AgriLED

AgriLED has become a catalyst for rural transformation in Kyenjojo District. By investing in farmer cooperatives, markets, and dairy infrastructure, the program is unlocking opportunities for smallholder farmers, strengthening cooperatives, and improving food security.

1. Coffee Processing Units – Kihura & Kyanyabongo Cooperatives

Figure 1 Farmers bringing coffee to Kyanyabongo coffee Farmers' cooperative

Figure 2 Seasonal Planning meeting at Kihura cooperative to prepare for the November harvesting season

- **Scope:** Construction of machine houses, solar drying yards, installation of hullers, and office facilities.
- **Impact:**
 - Kihura Cooperative now processes 1.5 MT of coffee per hour, purchasing coffee worth UGX 460 million from 350 farmers last season.
 - Kyanyabongo Cooperative processed coffee worth UGX 364 million, serving 334 farmers.
- **Future:** Both cooperatives aim to expand membership to 1,000 farmers by April 2027.

Learning: Strong cooperative structures can rapidly scale farmer incomes when supported with modern processing facilities.

Recommendations:

- Access to low-interest loans (UGX 500m–1b) to expand operations.
- Continued government support with subsidized seedlings to increase land utilization beyond the current 30%.

2. Mukunyu Market – Butiti Town Council

Figure 3 Mukunyu Market before the construction support by AgriLED

- **Scope:** Construction of stalls, lockups, garbage bunkers, VIP latrines, and parking yard.
- **Impact:**
 - The market is fully functional, housing vendors in safe stalls.
 - Food safety has improved, and vendors now operate in a structured environment.
- **Outcome:** A vibrant trading hub that enhances local commerce and community livelihoods.

Learning: Market infrastructure directly improves food safety and boosts local commerce.

Recommendations:

- Strengthen market management committees to ensure sustainability.
- Explore digital platforms for vendor registration and market information.

Figure 5 Current status of Mukunyu Market where vendors are now housed in stalls which has made food safer for human consumption

3. Dairy Cooperatives – Rugombe & Mwenge

Figure 6 Mwenge Dairy Cooperative trying to utilize the cooler but the volume is still not enough.

- **Scope:** Supply and installation of milk coolers, generators, and containers.
- **Impact:**
 - Equipment supplied, but functionality limited due to low milk volumes and power installation challenges.

Recommendations:

- Restocking farmers with improved dairy breeds through artificial insemination.
- Relocating Rugombe cooler to a town center for better utilization.
- Training farmer groups in business skills to strengthen market access.

Learning: Infrastructure alone is insufficient; productivity and market linkages must be strengthened simultaneously.

Recommendations:

- Restock farmers with improved dairy breeds through artificial insemination.
- Relocate Rugombe cooler to a town center for better utilization.
- Train farmer groups in business and marketing skills to strengthen market access.

Overall Impact

AgriLED projects in Kyenjojo District are:

- Strengthening farmer cooperatives through modern processing facilities.
- Improving food safety and market access via new infrastructure.
- Enhancing dairy productivity with cooling technology and breed improvement.
- Driving inclusive growth by targeting smallholder farmers and empowering local cooperatives.

Key Learnings

1. Integrated support is essential – infrastructure must be paired with financing, training, and market access.
2. Cooperatives are powerful engines – when well-structured, they can rapidly scale farmer incomes.
3. Food safety improves with infrastructure – structured markets reduce risks and enhance consumer confidence.
4. Dairy productivity requires restocking – coolers are only effective when milk volumes are sufficient.

Recommendations

- Provide low-interest financing to cooperatives, farmer associations and groups to expand operations.
- Scale up seedling distribution to increase land utilization.
- Strengthen market management committees and introduce digital tools.
- Restock dairy farmers with improved breeds and relocate underutilized coolers.
- Invest in business and marketing training for farmer groups.

Conclusion

AgriLED has laid a strong foundation for agricultural transformation in Kyenjojo District. With continued support—especially in financing, seedling distribution, and farmer training—the district can achieve full cooperative capacity, improved dairy production, and sustainable rural development.
